Problem Statement

Individuals struggle with unhealthy eating habits and irregular fitness routines due to lack of personalized, real-time guidance.Most apps provide the same advice to everyone without adapting to individual needs

- *This creates a gap between health awareness and actual healthy living.*

Objective

- To Improve Health and Lifestyle
- To develop Personalized diet and fitness recommendations
- To Encourage healthy habits through remainders
- To Make fitness guidance accessible without expensive trainers

Solution Overview

An AI-powered smart diet and fitness assistant that analyzes user data to generate personalized diet plans and workout recomendations. The system continously tracks user progress and provides real time feedback and remainders to help maintain a healthy lifestyle

- Adapts based on user progress
- Tracks daily calories and activity

AI Functions

01 User data analysis

AI analyzes inputs like age,weight,goal and activity level

02 Calorie & Fitness Prediction

Machine learning predicts daily calorie needs and fitness level

03 Personalized Recommendations

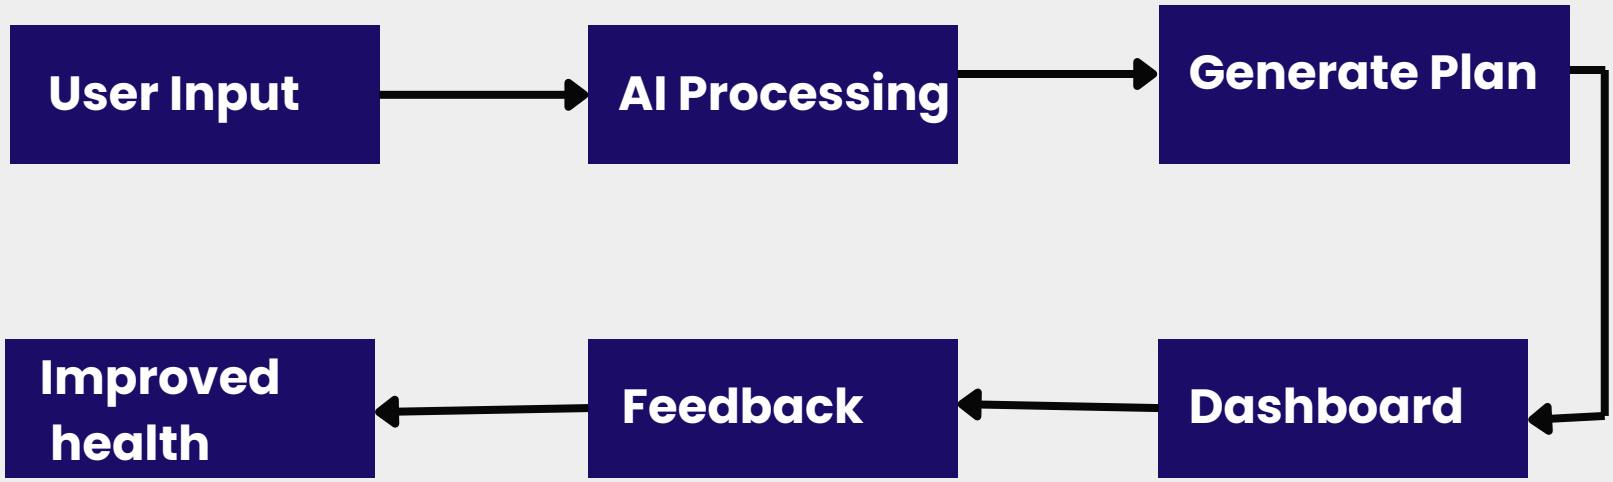
Generate customized diet plans and workout routines

04 Continous Learning and Improvements

Updates suggestions based on user progress and feedback

System Workflow

"A continuous AI-driven system that adapts to user behavior and improves health recommendations over time."



Tech Stack

Frontend: React + Next.js

Styling: Tailwind CSS

AI: Groq API

Auth: NextAuth.js

Database: MongoDB

Backend: Next.js API Routes

Deployment: Vercel

IMPACTS

01 Encourages better eating habits and regular fitness routines

02 Helps user build long term healthy habits,not just short term results

03 Can be used by millions simultaneously without needing human trainers

04 Adaptive plans keep users motivated,reducing chances of quitting midway

Future Scope

Wearable Device Integration

Connect with smartwatches to track real-time steps,heart rate and calories

AI Voice Assistant

Enable voice-based interaction for hands-free guidance

Computer vision for food detection

Use camera to scan meals and calculate calories

Advanced Health Monitoring

Include features like sleep analysis,stress tracking and hydration remainders
